

Git Basic Commands

1. *clone* = git clone + a repository_url

- creates a copy of your remote repository into your working directory locally.

2. *add* = git add

- is used to add changes in your working directory to the staging area. You do this before committing changes to your repository

3. *commit* = git commit -m "Your descriptive commit message"

- is used after you have staged your changes using git add, to commit your file to your repository (Remember, it's good practice to write clear and concise commit messages to make it easier to understand the history of your project.)

4. *push* = git push

- upload your local repository content to a remote repository

5. *rename* = git mv

- tells git to rename a file
